Wig Zamore, MS

This thesis focuses on the potential economic development and environmental health impacts of a 25,000 seat soccer stadium in the Inner Belt and Brickbottom neighborhoods of East Somerville, Massachusetts. The goal of this thesis is to provide recommendations to Somerville about development in the Inner Belt and Brickbottom neighborhoods as it relates to the relocation of the New England Revolution soccer stadium. To make recommendations to Somerville, 10 planning and economic development documents were reviewed from Carson and San Jose, California; Sandy, Utah; Harrison, New Jersey; Bridgeview, Illinois; and Portland, Oregon. These stadiums were built (or majorly renovated) for MLS soccer teams and have access to public transportation. Documents were reviewed for economic development and environmental health impacts.

There are many similarities between these other cities and Somerville including a need for a diversified tax base, replacing underutilized industrial sites, and creating a draw for their city. Somerville has shown that it has the capability to work with their residents on complex issues and should proceed with caution as they evaluate a mixed-use stadium development using an independent economic development impacts study and a health impact assessment.

ACKNOWLEDGMENTS

First and foremost, I would like to thank Professor Mary Davis, Professor Ann Rappaport, and Wig Zamore for their help and assistance throughout this process. With your help, I believe this thesis will do more than sit on a shelf. To my UEP friends, including classmates, faculty, and staff, thank you for your support personally and academically. To the city employees I spoke with throughout this process, thank you for the lively conversation and interest in my topic. And lastly, thank you to my family and friends for your love and support the last two years.

Chapter 1

INTRODUCTION

Stadium development across the United States has been rampant over the last 25 years ranging from the Centennial Olympic Stadium in Atlanta, Georgia to minor league baseball's Louisville Slugger Stadium in Louisville, Kentucky. The 'big four' leagues, MLB, NHL, NFL, and the NBA have built over 30 stadiums or arenas since 2000. During this time, Major League Soccer (MLS) has become a formidable league with twenty teams and thousands of dedicated followers. The league franchises have built 10 soccer specific stadiums in the last 12 years. The Kraft family owns and operates the New England Patriots and the New England Revolution, one of the league's ten founding teams. The New England Revolution play soccer at Foxboro Stadium, a stadium designed for National Football League games.

MLS has begun a campaign that all new expansion teams must play in a soccer-specific stadium (Economic Research Associates 2008). Currently, 13 of the 20 MLS teams have built (or majorly renovated) stadiums to seat 18,000-27,000 fans (HVS Consulting and Valuation Services 2009; Sports Economics 2008; City of Houston 2010). Since the Revolution is a founding team from 1996, they are not affected by this MLS campaign. However, this has not stopped

the organization from exploring options to relocate from the 68,000-seat Foxboro stadium, located 45 minutes outside of Boston, into a smaller urban stadium that fits roughly 25,000 fans. Twice in the last four years the Boston Globe (Moskowitz 2010; Moskowitz 2008) has covered rumors of relocation including the Inner Belt and Brickbottom neighborhoods of East Somerville. The President of the New England Revolution, then the Chief Operating Officer, has even answered questions about stadium relocation in a June 28, 2010 blog post, the Globe confirmed stadium relocation was a top priority for the team in March 2011, and Bilello again acknowledged the priority in March 2012 in a television interview (Bilello 2010; Dell’Apa 2011; NECN 2012).

The City of Somerville is currently working with residents in a visioning process to imagine the Inner Belt and Brickbottom neighborhoods after the Green Line Extension that is expected to start operation in 2016. In addition, a 2008 Scoping Study (CBT et al. 2008) commissioned by Somerville included a stadium utilizing air rights¹ over a Massachusetts Bay Transit Authority (MBTA) maintenance facility as part of a 160-acre site. The Inner Belt and Brickbottom neighborhoods are separated from the majority of the community by major roadways including Interstate 93, McGrath Highway, and Washington Street.

Redevelopment, including a 25,000-seat stadium, changes a neighborhood and affects the surroundings. The typical MLS schedule hosts fifteen home games between April and September plus playoffs. Each game would bring an influx of fans and vendors, traffic, light (for night games), and noise to a site surrounded by the typical Somerville housing stock, converted single families and triple-deckers. Somerville already has the greatest number of vehicle miles traveled per square mile in Massachusetts (City of Somerville 2010) but is anticipating relief from the Green Line extension.

1 Air rights is a term used in real estate development that symbolizes a development agreement to build above an existing property or land.

At the same time, Somerville is seeking economic development opportunities. Somerville has already established the following criteria for redevelopment of the Inner Belt and Brickbottom neighborhoods: reconnect to Somerville and surrounding communities including Cambridge and Boston, create mixed use development and open space, enhance transit access, rework infrastructure, and encourage a life sciences convergence with nearby universities (The City of Somerville 2011 e). Somerville loses 85% of its workforce population every workday to neighboring cities. These workers pay their own transportation costs and are more likely to spend money outside of Somerville. Somerville is looking for ways to employ residents to increase opportunity, increase their tax benefits, and help the local economy (The City of Somerville 2008).

The goal of this research is to explore potential neighborhood impacts, specifically economic development and environmental health impacts, of a stadium development in the City of Somerville by collecting and reviewing planning and economic development documents from other urban soccer stadiums. This thesis includes the following chapters, a brief history of Boston stadiums, Somerville, and Major League Soccer; a literature review focusing on stadium development, financing and economic development, and environmental health; the review of economic development and planning documents for six urban stadium sites followed by recommendations for Somerville. I chose this approach because much of the academic literature focuses on other US leagues: MLB, NFL, NBA, and NHL. By evaluating these new stadiums, the argument for stadium development can be further informed.

Chapter 2 **BACKGROUND**

STADIUMS IN BOSTON'S HISTORY

Boston has a storied history when it comes to its sports teams. From the Red Sox Curse of the Bambino to the Big Three of the 2008 Championship Boston Celtics, Boston is nationally known for being a sports town. The Boston metro area also has a history of professional soccer teams starting in the 19th Century (see Table 1). In 1894, the South End Grounds hosted the Boston Beaneaters and later in 1921 the Boston Soccer Club played games there. Fenway Park, the oldest stadium in Major League Baseball, also hosted a soccer team in 1967 for one season, the Boston Beacons (Foulds 2005).

In fact, Nickerson Field (Boston University), Balmoral Park in Andover, Malden Stadium, Everett Stadium, Manning Bowl in Lynn, Alumni Stadium (Boston College), and Bowditch Field in Framingham all have hosted professional soccer teams at one point in their history. Regionally, Sam Mark's Stadium, home to the Fall River Marksmen was the first soccer specific stadium in the U.S. Despite the team name, the stadium was in Tiverton, Rhode Island because Massachusetts blue laws prohibited games on Sundays (Foulds 2005).

Table 1 - Boston Metro Area Soccer Stadiums

Compiled from Boston's Ballparks & Arenas (Foulds 2005)

Stadium	Team	Year	City
South End Grounds	Boston Beaneaters	1894	Boston
	Boston Soccer Club	1921	
	Boston Wonder Workers	1925-1929	
	Boston Hubs	1926	
Balmoral Park	Shawsheen Indians	1925-1926	Andover
Sam Mark's Stadium	Fall River Marksmen	1922-1930	Tiverton, RI
	Fall River Football Club	1931	
Everett Stadium	Boston Wonder Workers	1929	Everett
	Boston Celtics	1931-1932	
Manning Bowl	Boston Shamrock Rovers	1967	Lynn
Fenway Park	Boston Beacons	1968	Boston
BC's Alumni Stadium	Boston Astros	1970	Chestnut Hill
	Boston Minutemen	1974	
Nickerson Field (Boston University)	Boston Astros	1970-1975	Boston
	Boston Minutemen	1975-1976	
	New England Tea Men	1979	
	Boston Bolts	1988-1990	
	Boston Breakers (Women's)	2001-2003	
Foxboro Stadium	Boston Minutemen	1976	Foxborough
	New England Tea Men	1978, 1980	
	New England Revolution	1996-2001	
Bowditch Field	Boston Storm	1994-1995	Framingham
	Boston Tornado (Women's)	1995	
	Boston Renegades (Women's)	1996-Present	
	Boston Bulldogs	1998-2000	
Harvard Stadium	Boston Breakers (Women's)	2009-2011	Cambridge
Gillette Stadium	New England Revolution	2002-Present	Foxborough

Furthermore, Harvard Stadium hosted soccer games for the Los Angeles 1932 Summer Olympic games and Foxboro Stadium hosted games for both the Men's and Women's national teams. It was actually the success and enthusiasm of fans at the 1994 World Cup that led to New England being chosen as one of the original MLS teams. In addition, MLS and the Women's United Soccer Association (WUSA) hosted their inaugural championship games at Foxboro Stadium (Foulds 2005).

The Boston metro area is no exception to the stadium expansion seen nationwide. In the last 25 years, of the three major venues in Boston, only Fenway Park remains. The Boston Celtics (NBA) and the Boston Bruins (NHL) play in the TD Banknorth Garden built in 1995 (opened under the name Fleet Center). Gillette Stadium opened in 2002 after the Krafts almost moved the Patriots to South Boston, Providence, or Hartford (Foulds 2005).

Plans to move the Patriots and Red Sox began in 1994, with a proposal for two new stadiums on the South Boston Waterfront. The stadium development was part of a \$1 billion project that included a convention center. The project was dead by the end of 1995 because of “size, cost, complexity, and political unwieldiness” (Powers 2002). Another stadium, only for the Patriots, was proposed. Thirteen hundred South Boston residents came to a public meeting to voice their disapproval for the project. Their protests were successful and the project was ended soon thereafter (Powers 2002).

Kraft, still needing a replacement for Foxboro Stadium, then looked to Hartford, Connecticut, where the team would play in a new stadium at Adriaen’s Landing paid for by municipal bonds and a sales tax on tickets. The deal fell through because the state couldn’t meet the original deadline of the 2002 season. In the end, the Kraft family, with private funds and \$70 million from the state of Massachusetts for infrastructure support, built the \$275 million Gillette Stadium (Foulds 2005; Delaney and Eckstein 2003a). In 2005, the Red Sox declared that they would stay at Fenway (Goodno 2005). To keep the stadium current it goes through renovations almost every off-season.

OVERVIEW OF SOMERVILLE

The City of Somerville is a diverse community bordering Boston, Cambridge, Arlington, and Medford (see Figure 1) and has been mentioned as a possible location for a new stadium for the New England Revolution. Somerville, the densest city in New England, is organized into a series of squares and

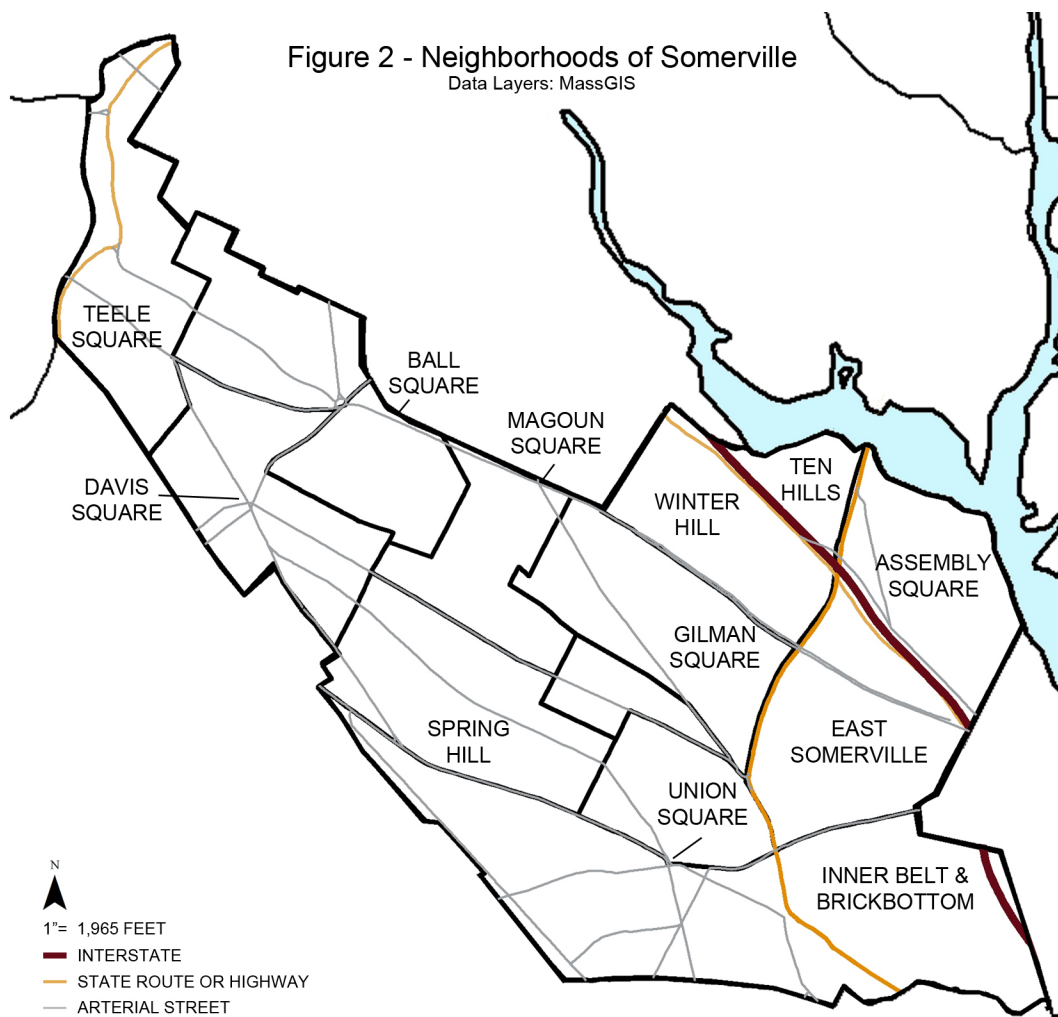

neighborhoods, most notably Davis and Union Squares (City of Somerville 2011a). Somerville is accessible by the Red and Orange lines of the MBTA and Interstate 93, and it will eventually be accessible by the Green line extension (see Figures 2 & 3).

The City of Somerville is a progressive government run by Mayor Joseph (Joe) Curtatone since 2004 (City of Somerville 2011b). In this time, the City has been named “The Model City” in the Boston Globe Magazine (2006) because of the local government’s cutting edge ideas and willingness to change. In 2009, the city won the All American City Award by the National Civic League. The honor awards communities whose citizens’ work together to address local issues

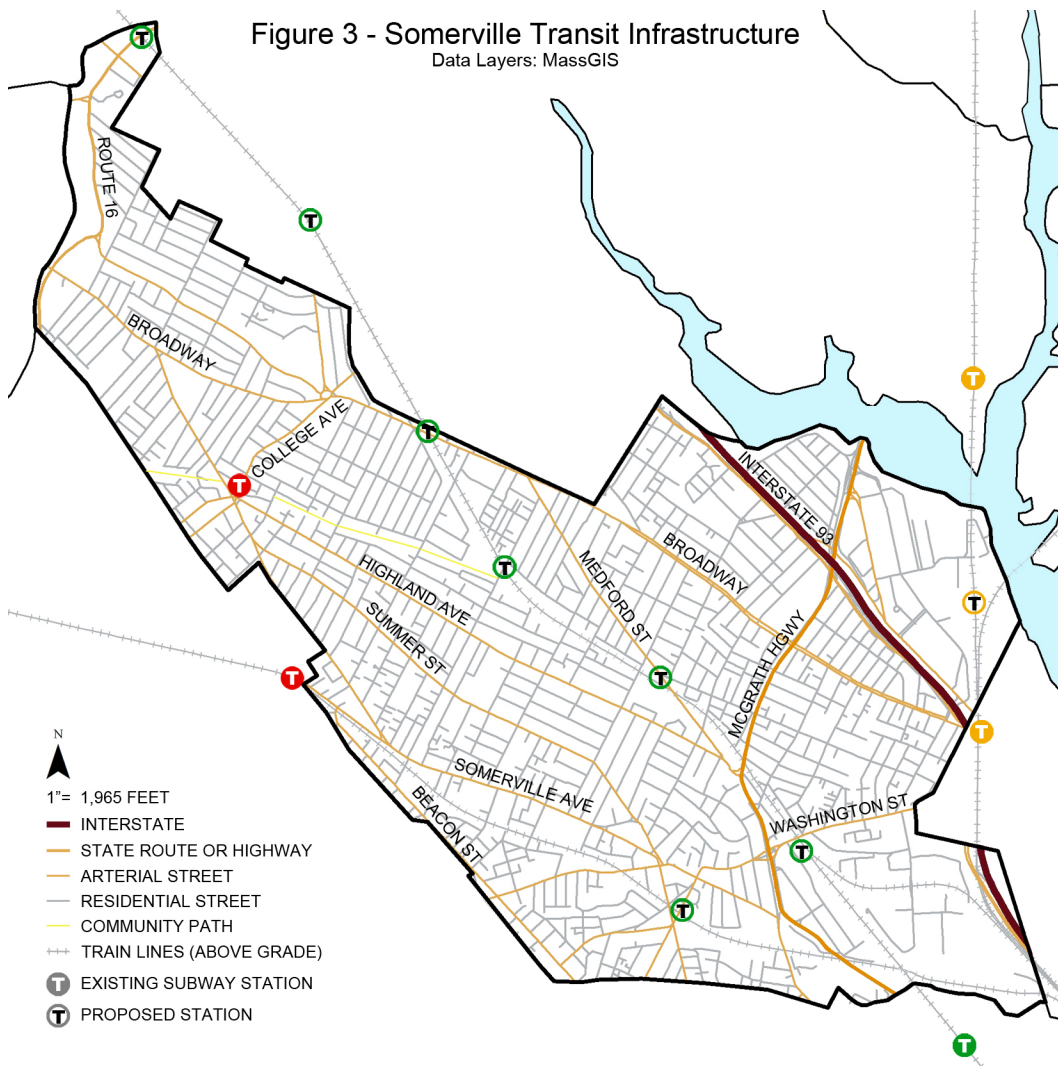

(City of Somerville 2011c). In 2010, Mayor Curtatone was honored as a keynote speaker for the kickoff of First Lady Michelle Obama's Let's Move campaign. Her program is similar to the initiatives of Shape Up Somerville, a program started in 2003 in collaboration with Tufts University (Roy 2010).

A Fiscal Year 2009 state report confirmed that Somerville is a "lean" city (Resistat 2011). Somerville spends the least per capita of any city in Massachusetts. This is the result of the Mayor and his team looking for ways to increase efficiency and decrease costs. Each year the State of Massachusetts has decreased funding to municipalities, and Somerville is no exception. Over the last 10 years, state aid to Somerville has decreased by \$20.7 million dollars or 13% of the City's operating budget (Resistat 2011).

Somerville has made numerous changes over the last 5 years to bridge that budget gap. They have converted the city to a single stream recycling service. The pilot program increased recycling rates which reduces disposal fees. Somerville has also increased several fees such as parking permits, visitor parking, and meter rates. This includes extending the meter times in business districts from 6 to 8 p.m., an additional 2 hours of revenue. The City sees this as preserving an urban community, encouraging residents to take alternative and sustainable forms of transportation, and increasing turnover in business districts (Guha 2009).

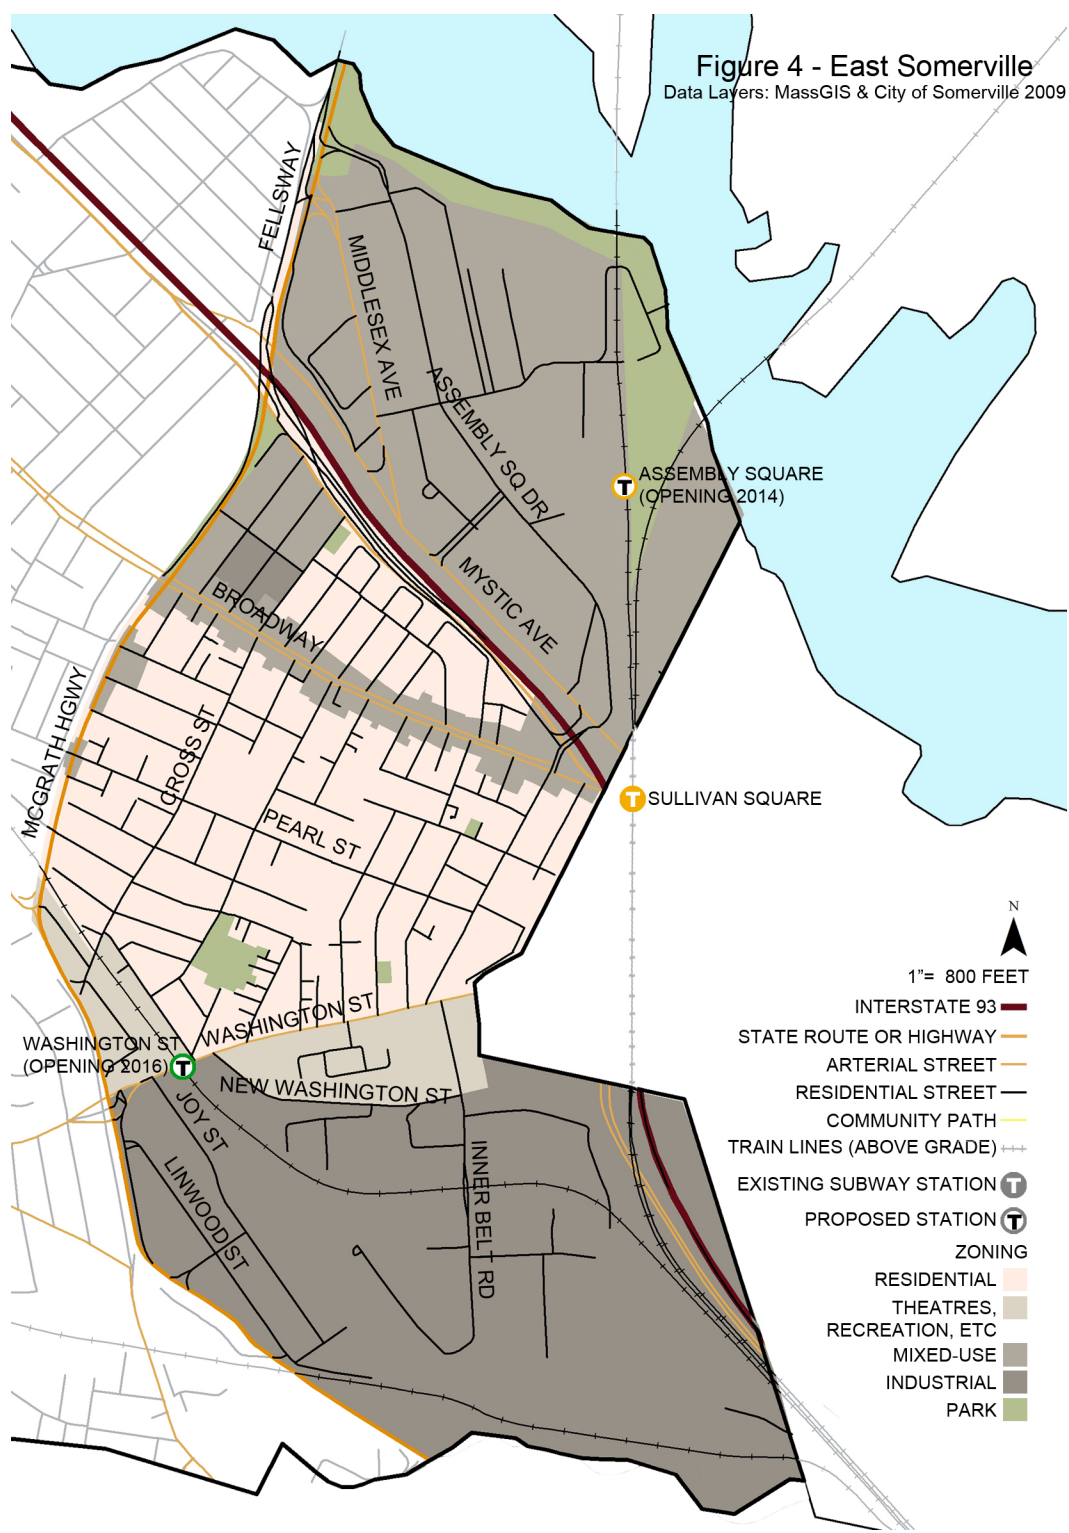

Another way of decreasing the budget gap is through development of commercial properties which have a higher tax rate than residential. For the most part, Somerville's 4.1 square miles are fully developed. Because of this, Somerville views underdeveloped land in high regard and wants to transform underdeveloped properties to their maximum potential. In addition, Somerville wants to increase employment opportunities for current and future residents. Some of the underdeveloped sites in Somerville are the vacant Powderhouse Community School in Teele Square, the Kiley Barrel site in Union Square, the MaxPac site near Davis Square, the Inner Belt and Brickbottom neighborhoods, and Assembly Square in East Somerville (see some of these sites in Figure 4). Somerville is currently home to 20,000 jobs and wants to increase to 50,000 jobs by 2030 (City of Somerville 2012).

Assembly Square and its redevelopment are an example of the City working with the residents to vision new uses for an underutilized area. Ford Motor Company operated a manufacturing facility on the site until 1958. In subsequent years, the building remained empty and several other surrounding manufacturing businesses closed. In 1980, the City adopted a 20-year urban renewal plan to improve the abandoned area, which included a mall of big box retailers and surface parking. In 2000, a new plan was adopted for the site that was a result of collaboration between the City and residents. The residents opposed large retailers using the waterfront for private business.

The new plan includes designs for a 145-acre mixed-use, transit oriented development (TOD) with accessible public green space along the Mystic River. The development is expected to bring in \$24 million tax dollars annually to Somerville, 9,700 new jobs, and retain 590 existing jobs. The real estate development has been slowed by the economic downturn but infrastructure improvements for the mixed-use district have started to take shape including a new stop of the MBTA's Orange Line called Assembly Square which is expected to open in 2014 (City of Somerville 2011d).

Figure 4 - East Somerville
 Data Layers: MassGIS & City of Somerville 2009

One of the other underdeveloped neighborhoods in Somerville is the Inner Belt and Brickbottom neighborhood (see Figure 5), the neighborhood identified as a possible location for the Revolution stadium. The neighborhood is on the eastern edge of Somerville bordering Cambridge and Boston. More specifically, the neighborhood is east of McGrath Highway, south of Washington Street, and West of Interstate 93. It is a 160-acre, or $\frac{1}{4}$ square mile, light industrial zone (The City of Somerville 2011e). The majority of the neighborhood has gone underutilized since 1970. The Inner Belt Highway project, a six-lane highway meant to connect Somerville, Cambridge, Brookline, and Boston ended at that time without a highway being built. Unfortunately, much of the neighborhood had already been demolished to prepare for the highway and interchange construction (The City of Somerville 2011e).

Currently, the Inner Belt and Brickbottom neighborhoods are comprised of low-density industrial and commercial uses, a different vernacular than the rest of Somerville. Properties along Washington Street match the context of Somerville and hide the industrial portion from drivers and pedestrians. The neighborhood is part of a fiber optic loop including Cambridge and Boston, which makes it more desirable to high technology tenants because of the high speed internet access (The City of Somerville 2008). Another attraction to the community in the Inner Belt and Brickbottom neighborhoods are the Brickbottom Artist Lofts. The lofts are one of the largest artist communities under one roof in the U.S. The lofts and an affordable housing development serving primarily elderly people account for the small population of the area (The City of Somerville 2011e).

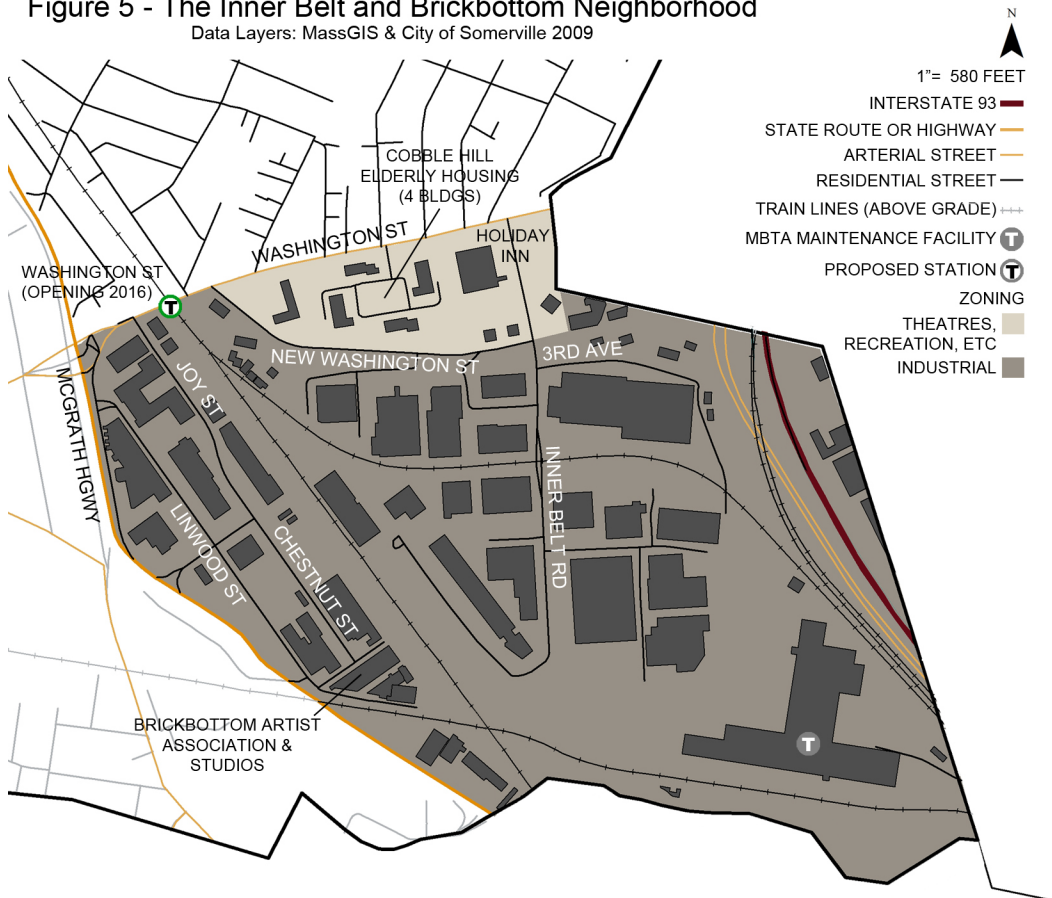

The Inner Belt and Brickbottom neighborhood are part of the larger East Somerville designation (see Figure 4). McGrath Highway, elevated through the majority of Somerville, separates East Somerville from the rest of the community. Interstate 93 further separates the neighborhood by dividing the Mystic and Assembly Square neighborhoods to the North and the Inner Belt

and Brickbottom neighborhoods to the South. Because of these two pieces of regional infrastructure, East Somerville shoulders the burden of transportation infrastructure for the region (The City of Somerville 2008). In total there are 250,000 vehicle trips on Interstate 93, Mystic Avenue, and McGrath Highway per day. In addition, there are 200 diesel rail trips (freight and commuter) per day (STEP 2011). The majority are in the Inner Belt and Brickbottom neighborhoods. The trains do not have a station in Somerville, they simply transport goods and people from the suburbs to downtown Boston.

The East Somerville neighborhood includes the residential areas that would be adjacent to a stadium. Table 2 summarizes the demographic differences

Figure 5 - The Inner Belt and Brickbottom Neighborhood

Data Layers: MassGIS & City of Somerville 2009

between the Inner Belt and Brickbottom neighborhood, East Somerville, Somerville, and the Boston Metropolitan Statistical Area using 2010 Census information. The majority of East Somerville residents work in service, production, and transportation-related fields (The City of Somerville 2008). These occupations tend to be low-paying, and 62% of East Somerville residents are low and moderate income (The City of Somerville 2008).

East Somerville’s housing stock is comparable to Somerville as a whole with a few exceptions. The majority of housing units were built between 1875 and 1925 and 86% have two or more units. With an aging housing stock there is concern of lead paint and fire hazards. Some of the housing is in poor condition and suffers from a lack of routine maintenance like painting and weatherproofing (The City of Somerville 2008). However, the biggest problem with housing in the East Somerville neighborhood is crowding. There are too many people living in inadequately sized housing. This is most likely due to

Table 2 - Demographic Comparison

Information Compiled from 2010 Census (unless otherwise noted)

	Inner Belt/ Brickbottom	East Somerville	Somerville	Boston MSA (Boston, Cambridge, Quincy, MA- NH MSA)
Population	468	17,606	75,754	4,552,402
Size (Square Miles)	0.25	1.08	4.14	3,630
Density (People per Sq Mile)	1,872	16,244	18,306	1,254
Median Household Income	n/a	37,560 ¹	61,731	69,983
Mean Household Income	n/a	n/a	74,884	93,077
Percent Unemployed	n/a	n/a	6.3%	6.9%
Median Age	60.9	33.72	31.4	38.5
Average Household Size	n/a	n/a	2.26	2.5
Percent White	87.6%	62.3%	73.9%	78.8%
Percent HS Grad or Higher	n/a	<65% ¹	88.8%	90.1%
Percent College Grad or Higher	n/a	<20% ¹	52.3%	42.1%

Note: Some information not available due to size of geographic region

¹ Information from *Five Year Consolidated Plan 2008-2013* (City of Somerville 2008)

the high cost of rent and real estate. Crowding in East Somerville is twice the citywide rate at 11% (The City of Somerville 2008). On a positive note, in East Somerville a third of the homes are owner occupied which is 3% higher than the citywide rate (The City of Somerville 2008).

Despite the challenges facing East Somerville, the City sees this area as an asset. They are currently engaged in a visioning process with residents of the Brickbottom and Inner Belt neighborhoods. Twenty percent of the land area is commercial and industrial use, the largest in Somerville, plus rental rates are still lower than Cambridge and Boston making it competitive (The City of Somerville 2008). The low-density Inner Belt and Brickbottom neighborhoods are home to 800 jobs. The City of Somerville wants to improve the infrastructure and services to this part of Somerville and sees many large areas of underdeveloped commercial land as potential for job growth and business (The City of Somerville 2008). In short,

“Somerville is under great pressure to expand its commercial tax base in order to relieve its citizens of the burden of funding basic city services with residential property taxes. Somerville’s commercial tax base remains very small in comparison to Boston and Cambridge that derive 66% and 60%, respectively, of their property tax revenue from businesses. By contrast, Somerville derives only 28% of its property tax revenue from businesses” (The City of Somerville 2008, 222).

Somerville values the Innerbelt and Brickbottom neighborhoods as a place to increase tax revenue with redevelopment.

HISTORY OF MAJOR LEAGUE SOCCER & THE NEW ENGLAND REVOLUTION

Major League Soccer (MLS) and the New England Revolution began their inaugural season in 1996. The international governing body of soccer, FIFA (The Federation of International Football Associations), awarded the United States the right to host the 1994 World Cup. In return, they expected the United States to start a new professional soccer league (Jewell and Molina 2005). The league

started with 10 teams, expanded to 12 in the second season, and contracted back to 10 in the third season. Although the first few seasons were uncertain, especially in some markets, the league has continued to grow and now has 19 teams in the US and Canada (Jewell and Molina 2005).

MLS set up their league differently than other professional soccer leagues of the past and many other professional leagues in the U.S. MLS is a single limited-liability company. Franchise owners own a stake in the league and their team and Major League Soccer owns 50% of each MLS franchise. MLS owns and negotiates all of the player contracts and is responsible for player allocation. Team owners have the right to 50% of the ticket sales, and the remaining percentage goes back to the league to pay for player contracts. This structure avoids larger markets (teams with higher tickets sales) taking good players from smaller markets. In other words, and using a different league as an example, this avoids the difference between the New York Yankees payroll and the Kansas City Royals payroll (Jewell and Molina 2005).

Because of this unique league structure, MLS players sued MLS for holding down salaries. In the 2000 decision on the antitrust lawsuit called *Frazier, et al. v Major League Soccer*, it was decided that the league structure did not defy the Sherman Act². The decision did not say that soccer is exempt from antitrust laws but that there was enough competition internationally that they did not create a monopoly (Jewell and Molina 2005; Fizek 2006). In 2007, MLS created the Designated Player Rule allowing teams to sign up to three players with only the first \$335,000 of their salary counting towards the team's salary cap. The first player to come to MLS under this new rule was international star David Beckham. There are now over 20 designated players in the league (Foss 2011).

Major League Soccer has a unique fan base. They have the largest female and Hispanic fan base of any professional sport representing 48.5% and 19% of the

2 The Sherman Act is a federal statute passed in 1890 that limit business activities that hinder competition in the marketplace.

fans, respectively. The NBA has the second highest Hispanic fan base at 14.5% and the NHL has the lowest at 10.2%. MLS followers also have the second highest income levels of the professional sports; 40% of fans make more than \$50,000 per year. This larger income indicates that soccer fans could have more discretionary income and may spend more at a soccer stadium. These demographics are important to potential sponsors and advertisers because they contain young professionals of both sexes with higher than average incomes. Currently, MLS stadiums generate a 77% utilization rate of their soccer specific stadiums or 19,250 people in a 25,000 seat stadium. In addition, MLS games attract over 10 million television viewers annually (Sports Economics 2008).

The Revolution play in the 68,000 seat Gillette Stadium (Foulds 2005). Gillette Stadium and Patriot Place, an outdoor mall next to the stadium, are 28 miles from downtown Boston. The stadium is surrounded by a sea of surface level parking and game day traffic clogs Route 1, a four-lane highway leading to interstates 95 and 495. The MBTA commuter rail runs commuter train service from Boston and Providence for all Patriots' home games but not for the Revolution games. These trains carry a maximum of 1,800 fans³.

According to Jonathan Kraft, Investor/Operator of the Revolution, Gillette Stadium "...provides a valuable economic environment for [the Revolution]. Without it, I don't know if this team would exist" (Dell'Apa 2011). The

Figure 6

Fewer in the stands for soccer

(Moskowitz 2010)

Each represents 1,000 people

3 Riding the T – New England Patriots. 2012. http://www.mbta.com/riding_the_t/patriots/ (accessed April 16, 2012).

Revolution, once one of the best-attended teams in MLS, used to draw up to 19,000+ fans per game (Sports Economics 2008). In the past few seasons they have only drawn around 12,000-13,000 fans per game (Moskowitz 2010; Tomasch 2012). The fans and team look dwarfed in the stadium (see Figure 6). The 2011 season saw only 5 wins. The team is currently in a large transition in the 2011-2012 offseason with changes to both the coaching and office staff (New England Revolution 2011).

The New England Revolution rarely comment on their work toward an urban stadium site except to state that this is a high priority of the team (NECN 2012). Their intentions can only be approximated by third party sources close to the team, like Frank Dell'Apa, the Boston Globe Staff and soccer columnist. In Dell'Apa's 2011 article he summarized interviews with Don Garber, MLS Commissioner and Jonathan Kraft, Owner/Investor of the New England Revolution regarding stadium development, "...the Revolution are not about to vacate Gillette Stadium unless they can find vacant land and receive financial aid from a municipality." In the article, Kraft acknowledges the challenges due to the economic downturn which have municipalities reprioritizing, and Garber acknowledges the need for both commercial revenue to fund a stadium and a municipality's role in garnering public support.

In an interview on New England Comcast Network (NECN 2012), Brian Bilello expressed that the New England Revolution's first priority is a soccer-specific stadium. This adds to previous news articles about the Revolution looking for an urban stadium site (Moskowitz 2010; Moskowitz 2008; Dell'Apa 2011). A new stadium could increase their chance at success including increased ticket sales. Major League Soccer wants to tap into the "young, urban demographic that so deeply loves the game and wants to experience it in a small urban environment" (Dell'Apa 2011).

Bilello further clarifies in his television interview that he understands that the Revolution need to work with municipal officials and make sure that a stadium is the right fit (NECN 2012). Dell'Apa states that the best scenario for the Revolution would be to combine two MLS stadium scenarios; the Seattle Sounders' Qwest Field's urban location with Sporting Kansas City's LiveStrong Sporting Park's financing. LiveStrong Sporting Park received \$150 million dollars in public funds (Dell'Apa 2011). It's likely the New England Revolution believe a funded, urban locale would be best for their organization.

Chapter 3

LITERATURE REVIEW

Stadium development is rarely about the stadium alone. Stadium owners strike financing deals with municipalities, offer promises of employment and community involvement, and build stadiums that attract thousands of people to otherwise quiet areas. Cities across the US have started to abandon rural stadiums on cheap land with urban infill stadiums that promote entertainment and cultural districts. No matter the sport, it is important to understand the recent history of the stadium debate including arguments about stadium financing, economic development, community morale, and environmental health.

STADIUM DEVELOPMENT

History of Stadium Development

The boom of stadium construction in the last 25 years is not surprising considering the fundamental changes in stadium development, increase in subsidies, and the success and interest in professional sports teams. Before 1945, teams played in privately owned stadiums. After World War II, there was an increase in the popularity of sports but most teams continued to rent stadiums from private owners (Delaney and Eckstein 2003a). With increasing

coverage on television, cheaper transportation options, and swelling population in the South and West, teams that were once regional pastimes saw the opportunity to capitalize on a new fan base (Delaney and Eckstein 2003a; Noll and Zimbalist 1997). Numerous teams in the saturated markets of the Northeast moved in favor of being the only franchise in a new city (Noll and Zimbalist 1997). These new cities, like many after World War II, had two income households and were focusing on educating their family leading to an increase in attendance at cultural events (Curry, Schwirian, and Woldoff 2004). Municipalities jockeyed over the right to host teams and gain notoriety with them. New stadiums, sometimes built by the municipality, were a way to lure the team to the city. Politicians that supported using municipal dollars to construct the stadium often touted economic development benefits and the increased morale of citizens as a reason for the expense (Delaney and Eckstein 2003b).

Stadium Financing

Supporters of stadium development will argue that stadiums increase economic development opportunities and therefore should be subsidized to encourage their development. Stadium financing refers to who pays for the construction of the stadium and operating the stadium once it's opened (Noll and Zimbalist 1997, 6). Sports franchises have used stadium financing as a way to pit city versus city in an effort to get the best available deal for their team. This makes stadium funding a contentious debate between franchise owners, city and state officials, and local residents because they are competing for public dollars against other wants and needs including public transportation, environmental cleanup, infrastructure improvement, ADA accessibility, and housing (Curry, Schwirian, and Woldoff 2004).

Building a stadium usually takes a mix of resources. Teams make a financial plan that generally has three components: corporate sponsorships, expenses paid by the professional team, and expenses paid by a local or state government.

Table 3 - MLS Stadium Financing

Compiled from Economic Research Associates Report (2008) Table 6 Unless Otherwise Noted

City	Team	Stadium Name	Stadium Cost (in millions) ¹	Stadium Financing ¹	Other
Bridgeview, IL	Chicago Fire	Toyota Park	90	100% Public	Subsidized by the City of Bridgeview
Houston, TX	Houston Dynamo	BBVA Compass Stadium	80 ²	100% Private ²	Stadium Built on public land - Dynamo will lease the stadium after construction for \$65,000/year. Some infrastructure support provided.
Carson, CA	LA Galaxy & Chivas	Home Depot Center	95	100% Private	Stadium built on the campus of California State University-Dominguez Hills (state land)
Harrison, NJ	NY Red Bulls	Red Bull Arena	200	Yes	Subsidy not specified
Chester, PA	Philadelphia Union	PPL Park	115	75% Public/ 25% Private 33% PUBLIC/ 66% Private ⁴	\$80 million in private investment. Other investment were state, fed, and quasi gov agencies
Portland, OR	Portland Timbers	Jeld-Wen Field*	36 ³		\$11.1 Million to be paid in rent
Sandy, UT	Real Salt Lake	Rio Tinto Stadium	118	38% Public/ 62% Private	Real Salt Lake is co-owned by Salt Lake County and Real Salt Lake MLS, naming rights sold for 1.5-2 Million to Rio Tinto
San Jose, CA	San Jose Earthquakes	n/a	n/a	n/a	Financing not finalized

* Majorly Renovated Stadium

The government issues bonds⁴ in order to help pay for the development (Noll and Zimbalist 1997). The government then repays the lender(s) with interest. Municipalities pay back the debt in a variety of ways which can include an increase in sales tax, an additional tax on ticket sales, savings from cuts in public services, and/or increased real estate tax income on the stadium property (Noll and Zimbalist 1997).

Another way of subsidizing a stadium is by giving government owned land or providing money to purchase land for the project. One example of this is the new Yankee Stadium which was built on 22 acres of public parkland adjacent to the old Yankee Stadium (Johanson 2009). Harrison, New Jersey gave 40 million dollars for land acquisition. The Houston Dynamo and the LA Galaxy play in stadiums that are built on municipal and state land respectively. See Table 3 for stadium financing of Major League Soccer Stadiums.

Even stadiums that tout being subsidy free don't necessarily come without a cost to municipalities. The San Francisco Giants have one of the few stadiums built with 100% private funds. AT&T Park, built in 2000, used \$186 million from the sale of personal seat licenses and naming rights to finance the stadium. The stadium cost \$307 million to build, but the city of San Francisco paid for a new light rail transit stop, street lighting, and public utility connections (Delaney and Eckstein 2003a).

Economic Development

The majority of evidence states that stadium development does not contribute to economic development (Delaney and Eckstein 2003a; Noll and Zimbalist 1997; Coates and Humphreys 2000; Santo 2005). Editors Roger Noll and Andrew Zimbalist gather the most common arguments in *Sports, Jobs, and Taxes* (1997)

4 Bonds are a type of loan that pays the lender back in a specified period of time including principal and interest. The Wall Street Journal. 2012. What is a Bond? <http://guides.wsj.com/personal-finance/investing/what-is-a-bond/> (accessed April 16, 2012).

the preeminent book for people against stadium development as an economic development tool (Santo 2005). However, stadium development has changed from the time of their research from rural cookie-cutter stadiums to urban contextual stadiums, which has continued the debate. Santo (2005) more recently argued against the 'one size fits all' approach of the research in Sports, Jobs, and Taxes (1997).

Either way, the expectations are high for major league teams: "redevelopment projects must do more than just enhance the urbanscape. They are expected to create jobs, stimulate business, attract new investment to the downtown area, make the city more lively and user friendly and enhance the fiscal health of the city government" (Curry, Schwirian, and Woldoff 2004, 37). Matheson in the Handbook of Sports Economic Research (2006) acknowledges that these expectations have received significant attention in the United States but little has been written about soccer specifically. These stadiums will become even more common since MLS (17,872 average attendees per game) has overtaken the NBA and NHL as the third most attended sport behind the NFL (66,960) and MLB (30,352) (Edwards 2011).

Support for Stadiums as Economic Development Tools

Some supporters of stadium development see economic development as the primary reason for a new stadium. To these people the three main benefits are temporary employment for construction trades, permanent employment caused by the operation of the stadium, and increased development around the stadium site such as restaurants and souvenir shops (Delaney and Eckstein 2003a). Benefits exclusive to the municipality are an increase in tax revenue from ticket sales, concessions, and real estate taxes (Delaney and Eckstein 2003a). Curry et al (2004) list three reasons to host sporting events from amateur teams like AAA baseball to the Olympic games; first, cities want the prestige that comes from hosting a team; secondly, they want to stimulate local businesses; lastly, they want to use the team as a way to provide for or reason

for major urban redevelopment projects. This list could also be used to describe the wants of municipalities hoping to recruit a team.

More recent studies like Charles Santo's "The Economic Impact of Sports Stadiums Recasting the Analysis in Context" try to cover economic development and urban stadiums. In his 2005 Urban Affairs article, he acknowledges the breadth of information supporting the argument that stadium development cannot spur economic development but notes some exceptions. Santo evaluated stadiums from 1984-2001 that had experienced a change in NFL or MLB franchises or stadium construction with mixed results. His results show that the presence of a new baseball stadium can have a significant positive impact on a metropolitan statistical area's (MSA) income share. He also notes that stadium location is important. The football and baseball stadiums that had a positive correlation with MSA income share were located in downtown areas. Santo did not define the characteristics that make a downtown area in his journal article.

Mark Rosentraub in *Sports, Jobs, and Taxes* (1997) analyzed 12 cities with downtown stadium developments (10 midwestern and 2 southern) for changes in employment, population, and employment sectors. Cities with downtown stadiums lost less of their population (11%) versus cities without stadiums (13.3%). For both cities with and without stadiums there was a decline in employment opportunities in central business districts including finance, insurance, and real estate (FIRE) sectors.

Indianapolis, which made a cluster strategy around sports, did better in this analysis than the other cities. Rosentraub explains that they had a downtown redevelopment plan that included professional sports and national sports organizations (like NCAA) (Noll and Zimbalist 1997). Indianapolis attracted spectators and employers to their downtown with their sports strategy. This strategy combated traditional viewpoints, "The factors that attract businesses

and people to suburban locations are more powerful than the roar of the crowds or the crack of a bat at nostalgic facilities, despite all their architectural splendor” (Noll and Zimbalist 1997, 206). Robert Baade and Allen Sanderson (1997) acknowledge that stadiums built as part of a large commercial and residential development tend to fare better at increasing economic development than suburban stadiums tailored to automobile efficiency.

Opposition to Stadiums as Economic Development Tools

Opponents of stadium development as a tool for economic development express a variety of concerns. The first is that the evaluation of the site compares the stadium development to the alternative of leaving the area undeveloped. Other economic development documents calculate that spending at the stadium and adjacent new developments are new expenditures and not creating a substitution effect from other entertainment and retail districts of the city (Noll and Zimbalist 1997). Expectations for income also change depending on whether the team has recently located to the city or is just in a new stadium. If a stadium moves to a new municipality, income is increased since the ticket and concessions sales are new. However, a new stadium in the same city might only create an incremental increase in these sales (Delaney and Eckstein 2003a).

Indirect tax revenues, or spending from tourism, that is accounted for in economic development plans are also frequently overstated. Noll (1997) summarizes this with numerous examples. For instance, a family could visit Boston and take in numerous historical attractions, museums, and also go to a baseball game. Depending on the parameters of the economic development plan their entire vacation could be attributed to the Red Sox. This overstatement is also seen in multiplier effects or businesses near the stadium making money and spending it in the community. Noll argues, “the

local economic effect of a sports facility is between nonexistent and extremely modest” (Noll and Zimbalist 1997, 15).

Furthermore, some plans account for ever-increasing attendance figures driving a consistent increase in tax revenue. This has been proven false: stadiums usually see increased attendance the first few years of a new stadium, but attendance figures are more likely increased if the team is successful (Noll and Zimbalist 1997). More so, attendance is increased when the outcome of the game is more uncertain and the teams are well matched with one another. Victor Matheson analyzed European soccer matches in the Handbook of Sports Economic Research (2006) and found that games with the league title on the line can attract an additional 13,000 spectators versus a game that did not decide the champion. Another study summarized that “fans come to games where they expect that the home team will win in a high-scoring but not too lopsided game” (Fizel 2006, 121). These studies find that competition within the stadium increases ticket sales more than having a new stadium.

The financial plans cannot account for businesses that may not come to the area because of the stadium. This is the opposite of what supporters of stadiums as an economic development catalyst hope for since it decreases economic development opportunity. In Phoenix, some employers were concerned about being too close to the stadium and having to compete for parking and deal with traffic (Delaney and Eckstein 2003a).

There are additional critiques of stadium development that focus on the financial goals of the teams, since they don't necessarily share the same interests of their host municipality. In recent years, beginning with Camden Yards for the Baltimore Orioles, stadiums have gone to further lengths to keep spending inside the stadium with interior themed 'streets' providing entertainment before and after the game. Gates open earlier so fans can enjoy the ambiance of the stadium but end up spending more money within the

stadium on things like concessions than in the neighborhood (Delaney and Eckstein 2003a). Spending inside the stadium is further critiqued: Stadiums tend to favor national brands so concession and souvenir money goes to large corporations like Coca Cola instead of local suppliers (Delaney and Eckstein 2003a).

Many people are against subsidizing new stadiums because of the increasing profit of team owners and salaries of professional athletes. Before the stadium boom, the majority of revenue came from ticket sales so new stadiums were primarily built to accommodate more seating. Now, teams are finding new ways to increase income including naming rights of the stadium, pouring rights (exclusive beer and soda sales), broadcasting rights, concessions, food retail inside the stadiums, and luxury seating (Noll and Zimbalist 1997). For instance, Fleet Bank bought the naming rights to Boston's new NBA and NHL arena for 15 years in 1995 for 30 million dollars (\$44.5 million in 2011 dollars) and called it The Fleet Center (Noll and Zimbalist 1997). It is now called TD Banknorth Garden, since Fleet Bank no longer exists.

Other Benefits

Because of the differences in research outcomes and the need to evaluate urban and suburban stadiums differently, supporters of stadiums as economic development tools have begun to use less tangible benefits in their arguments. Kevin Delaney and Rick Eckstein (2003) argue that these less tangible benefits are brought up because they are harder to argue against and cannot be combated with academic research. Supporters cite an increase in "community self-esteem" and "community collective conscience" as being a positive benefit for the city but they cannot be as easily quantified as monetary gains (Delaney and Eckstein 2003a, 4). However, Kuper and Szymanski (2009) argue that happiness is a relatively new measurement and that politicians

(people promoting stadium development) have realized that a happy community is just as, or more important, than a rich community.

More specifically, these benefits are seen two ways; first by changing the way people think about their own city and second by changing the way others outside the community perceive that city (Delaney and Eckstein 2003a). Community consciousness arguments can be seen in campaigns like Cincinnati's, "Keep Cincinnati a Major League City" (Delaney and Eckstein 2003a, 54). A professional sports team brings publicity and an appeal to a city as well as bringing citizens closer together in solidarity. Lastly, Delaney and Eckstein (2003a) point out that professional sports teams are what corporations and CEOs (unaffiliated with professional sports) want to see. To business leaders it's a matter of recruiting and being able to showcase what their city has to offer (Delaney and Eckstein 2003a).

Contemporary stadium development requires teamwork from municipalities, franchises, league organizations, and private developers. There is no standard formula for development and each project takes its own shape. In the end, cities can call themselves home to a favorite sports team but few have summarized the benefits, especially for Major League Soccer stadiums. Santo (2005, 190) summarized his study: "a facility's ability to impact its local economy is tied to its context." He argues that urban and suburban stadiums have different economic development capabilities. An MLS stadium in Somerville is an urban but unique context that requires further research.

ENVIRONMENTAL HEALTH

Noise

Half of Major League Soccer (MLS) teams have their own open-air stadium. The noise created inside such a stadium is not contained and is likely a cause for concern for residents surrounding the stadium. Most research focuses on traffic and urban noise and does not focus specifically on noise from a stadium (Stansfeld et al. 2005; Vernez Moudon 2009; Chepesiuk 2005; Pandya 2003). However, many stadiums are part of an urban environment and can exacerbate environmental noise.

Regulation of environmental noise, including regulation on occupational and community exposures, has waxed and waned over the last 60 years. In the 1970's, due to industrialization and the advancement of transportation, there were several pieces of legislation enacted, including the 1978 Quiet Communities Act (Vernez Moudon 2009). In 1974, the U.S. Environmental Protection Agency (EPA) set guidelines for outdoor noise levels: a 70 decibel maximum in outdoor areas to avoid hearing loss and 55 decibels for acceptable sound levels to prevent annoyance or activity interference. However, in 1982 when the federal government started shifting more control to state and local governments, the noise control division of the EPA was defunded. In an odd twist, Congress never rescinded the noise control legislation with the above standards and the same regulations stand today but go unenforced (Vernez Moudon 2009).

Despite regulation on noise, urban environments have gotten increasingly louder (Vernez Moudon 2009). Ron Chepesiuk (2005) and Anne Vernez Moudon (2009) compiled lists of physical and psychosocial impairments. Loud and/or constant noise can damage the inner ear and result in permanent hearing loss, elevated blood pressure, increased heart rate, cardiovascular constriction, loss of sleep, labored breathing, and changes in brain chemistry.

Psychosocial changes could include increased aggression, annoyance, and reduced performance quality. Even non-consistent noise or bursts of noise can impair task performance (Abarghani et al. 2009). However, different noise levels and consistency can have varying effects on retention tests (Abarghani et al. 2009). Research also shows that noise exposure in children can lead to decreased cognitive performance including reading, attention, and memory (Vernez Moudon 2009; Chepesiuk 2005; Wells, Evans, and Yang 2010). In the last 15 years, researchers have increasingly linked transportation noise to cardiovascular health (Walker 2012).

Although regulation in the United States does not have an enforcing body, it hasn't stopped other organizations from combating noise. In 2000, the World Health Organization (WHO) released guidelines for occupational and community noise levels (Vernez Moudon 2009). In turn, the European Union released their own regulations including a requirement that cities with a population over 250,000 monitor noise levels (Vernez Moudon 2009). This resulted in noise surveillance programs. Nationally, New York City and San Francisco have municipal noise ordinances. San Francisco leads the U.S. in documenting land uses that contribute to noise exposure (Vernez Moudon 2009). Meteorological factors like rain, temperature, and wind can also affect the intensity of noise by as much as 10 decibels (Walker 2012).

Specific to soccer stadiums, a recent noise study was completed at Ali Sami Yen Stadium, home to the first division team Galatasaray in Istanbul, Turkey (Akdag and Dal 2011). The stadium is capable of holding 26,000 fans and is located in a bustling commercial and residential district. Researchers used noise mapping and surveys of local residents to assess conditions on game and non-game days. Their research showed that according to Turkey's noise limit regulation, known as the Assessment and Management of Environmental Noise (AMEN), residents were exposed to high levels of urban noise. Every day 7,700 of the

32,000 residents (24%) are exposed to unacceptable levels of urban noise but on game day that number increases to 11,750 residents (37%).

A recent study explored the impact of soccer noise on spatial retention in rats (Abarghani et al. 2009). Groups of rats were trained on a maze while being exposed to a recording of a stadium during a soccer game. The groups were split into varying noise levels: high, medium, and low intensity sound. The groups that were exposed to the same level of noise during training and the final test finished in similar time. However, when exposed to different decibel levels (higher and lower) during the final task, performance declined.

Both studies do not discern the types of noise coming out of the stadium. However, the exhibition games leading up to and during the 2010 World Cup in South Africa put the local instrument, the vuvuzela, into mass production. Known for its very loud and distinct vibrating sound, the vuvuzela can be heard for miles around a stadium (Hall and Swanepoel 2010). The noise values produced by vuvuzelas exceed international limits for occupational settings. Two separate studies evaluated spectators hearing and the noise levels from a vuvuzela (Hall and Swanepoel 2010; Hall, Koekemoer, and Swanepoel 2010). They concluded that the intense sounds from a vuvuzela over the duration of a soccer game can put users and spectators "at a significant risk of noise-induced hearing loss" (Hall, Koekemoer, and Swanepoel 2010, 100).

Quite differently, Chase and Healey (1995) compared neighborhood nuisance ratings of noise levels for soccer games and rock concerts at the same stadium. Regarding noise exclusively, soccer games had small spatially confined areas of residents reporting the nuisance, which dissipated with distance. Rock concerts have more variability in noise complaints. Many new stadiums are multi-use in order to increase viability and justify development with more events per year.

There is no question about the detriments of constant exposure to sound. The lack of enforced regulation in the United States has allowed transportation,

machinery, and a variety of land uses to expose neighbors and communities to “secondhand noise” (Chepesiuk 2005, 36). Researchers have suggested the use of Health Impact Assessments (HIA) to gauge the impacts of specific projects (Vernez Moudon 2009; Wells, Evans, and Yang 2010). HIAs provide information to policy makers with research-based evidence that can inform the debate about a specific policy or development (Wells, Evans, and Yang 2010). Wells et al. summarizes the use of HIAs as a “promising mechanism for incorporating health issues into the planning process” (2010, 135).

Some stadium developers have listened to the neighborhood concerns about noise and included features like land berms into the stadium designs (Bay Area Economics 2006). Geographical features like large expanses of trees and grass can have a great effect on noise and can help absorb sound (Walker 2012). Even though noise and its affects are frequently considered in stadium design, without an enclosed (domed) structure, stadiums will share noise with the surrounding community.

Traffic & Parking

Traffic and parking are frequently the primary issues with local residents, especially in a built environment that is heavily reliant on car travel with already limited parking space. Even with public transportation nearby, a stadium cannot expect that every spectator will use public transportation. In rural England, Sheffield Wednesday Football Club’s stadium seats 30,000 people and city officials expect 90% of those people to travel to the stadium by car (Naldrett 1995).

Older stadiums struggle with the influx of cars and short term parking demand, which can force attendees onto neighborhood streets, even blocking driveways. New stadiums, sometimes in rural locations, have either seas of asphalt or parking garages that bring no value to the neighborhood except storing cars on game days (Naldrett 1995). Carson, California widened

intersections after the stadium events began and traffic delays were found. The first four games were described by the city traffic engineer as “a traffic disaster” (Bay Area Economics 2006, 13).

Sheffield Stadium reports a manageable build up to the game since spectators often come to enjoy the neighborhood and pre-match festivities. However, traffic peaks 45 minutes after the game when people are in a rush to go home but are only going 100 meters (109 yards) every three minutes (Naldrett 1995, 12). Newer stadiums like the Red Bull Stadium in Harrison, NJ acknowledge the importance of transit access as well as bike and pedestrian accessibility (Bay Area Economics 2006). Overall, the current approach of quantifying increased cars per day and analyzing traffic patterns around stadiums after events does not fully describe the effects of increased stress and pollution on neighborhood residents.

Alcohol Abuse

Another nuisance often not mentioned directly is alcohol consumption inside the stadium resulting in intoxicated patrons exiting the event. Vingilis et al (1992) focused on motor vehicle accidents in Toronto after alcohol sales were permitted at the Canadian National Exhibition (CNE) baseball stadium. They found the results mixed, with no direct relationship between the sale of alcoholic beverages and increased motor vehicle accidents. CNE stadium has access to reliable public transportation but researchers did not focus on an increase in incident reports from the transit authority after the inclusion of alcohol sales.

Erickson et al (2011) conducted a study asking fans leaving professional football and baseball games to allow their blood alcohol content (BAC) to be taken followed by a brief survey. Of the 362 in their sample, 60% had a BAC of zero. Of the remaining 40%, people who had reported tailgating had higher odds of having a mid-range or high BAC. People under the age of 35 had twice

the odds of having a mid-range BAC and over nine times the odds of having a high BAC than a zero BAC. Additionally, games on Fridays and Mondays had fans with higher BACs. Eight percent of the sample had BACs over the legal limit for driving. If their sample is representative, approximately 5,000 attendees of NFL games would leave with blood alcohol content above the legal limit. Using the same percentages for a 25,000 seat stadium, 2,000 people are leaving the stadium with BACs over the legal limit for driving.

Lighting

Regarding new development, it is assumed that new stadiums will have lighting for evening and night games. Wrigley Field, home to the Chicago Cubs, is one of the oldest major league ballparks and has a modest seating capacity. After a long permitting process, Wrigley Field was allowed to add lighting and began night games in 1988. The Lakeview/Wrigleyville neighborhood saw an increase in traffic (possibly due to the game time coinciding with commute times) and further instituted parking restrictions to combat the influx. During public hearings regarding lighting Wrigley Field, a survey revealed that only 22% of residents (those living within a half-mile of Wrigley Field) would accept lighting at the stadium. The remaining 78% would rather have the Cubs relocate. With the increase of nighttime baseball, the neighborhood has changed into more of an entertainment district than a neighborhood. Besides the addition of lighting at Wrigley field, current literature does not highlight lighting itself as a benefit or nuisance to the surrounding neighborhood (Spirou and Bennett 2002). Dartford Soccer Stadium in England was concerned about their neighbors' perception of their new stadium in 2006. Instead of only building up from the ground level, they lowered the field level inside the stadium leading to a lower elevation of field lighting to lessen the impact of light pollution in the neighborhood (Craik 2008).

In summary, stadiums can contribute to environmental health outcomes and the economic development potential in a neighborhood, but the results are mixed. Stadiums may serve as an anchor tenant in a redevelopment project, contribute to noise in a neighborhood, and increase less tangible benefits like community self esteem.

Chapter 4

METHODOLOGY

The current literature on American 25,000 seat soccer stadium developments including their impacts is lacking due to the short duration in which these stadiums have existed. Stadium developments like these are similar to lower division soccer leagues in Europe but infrastructure and cultural differences make comparisons difficult. The potential impacts of a soccer-specific stadium development in the Inner Belt and Brickbottom neighborhood have been determined by collecting and reviewing planning and economic development, interviews with local officials and stakeholders, and GIS analysis.

Economic development and planning documents have been collected for teams in the United States that have a MLS tenant soccer specific stadium and access to public transportation. Table 4 highlights stadiums that fit these requirements.

Of the twenty MLS teams, three are from Canada and are excluded due to differences in the planning process. Of the fifteen teams in the United States, eight teams have their own stadium (two are in planning/construction) and

Table 4 - US Major League Soccer Stadiums and Selected Characteristics

Compiled November, 2011

Team Name	Stadium Location	Soccer Specific	Name of Stadium	Year Opened	Nearby Metro Area	Transit Access
Chicago Fire	Bridgeview, IL	Yes	Toyota Park	2006	Chicago, IL	Yes
Houston Dynamo	Houston, TX	In construction	Dynamo Stadium	2012	-	Yes
LA Galaxy & Chivas USA	Carson, CA	Yes	Home Depot Center	2003	Los Angeles	Yes
NY Red Bulls	Harrison, NJ	Yes	Red Bull Arena	2010	NYC, NY	Yes
Philadelphia Union	Chester, PA	Yes	PPL Park	2010	Philadelphia	Yes
Portland Timbers	Portland, OR	Yes	Jeld-Wen Field*	2011	-	Yes
Real Salt Lake	Sandy, UT	Yes	Rio Tinto Stadium	2009	Salt Lake City	Yes
San Jose Earthquakes	San Jose, CA	In permitting	n/a	2013	San Francisco	Yes
Colorado Rapids	Denver	Yes	Dick Sporting Goods Park	2007	-	No
Columbus Crew	Columbus	Yes	Crew Stadium	1999	-	No
DC United	Washington, DC	No	RFK Stadium	1961		Yes
FC Dallas	Frisco, TX	Yes	Pizza Hut Park	2005	-	No
NE Revolution	Foxborough, MA	No	Gillette Stadium	2002	Boston & Providence	No
Seattle Sounders	Seattle, WA	No	Century Link Field	2002	-	Yes
Sporting KC	Kansas City, KS	Yes	Livestrong Sporting Park	2011	-	No

Note: MLS has 3 teams in Canada that are not included in this list

* Jeld-Went Field is a majorly renovated stadium

access to public transportation. Information from the following municipalities have been selected for review because they fit both requirements:

- Bridgeview, Illinois - Chicago Fire
- Houston, Texas - Houston Dynamo
- Carson, California - LA Galaxy and Chivas USA
- Harrison, New Jersey – New York Red Bulls
- Chester, Pennsylvania - Philadelphia Union
- Portland, Oregon - Portland Timbers
- Sandy, Utah - Real Salt Lake
- San Jose, California - San Jose Earthquakes

There were 11 planning, economic development, and state mandated documents collected and 1 interview with a planning consultant in lieu of documents (see Table 5). Economic development and planning documents for Chester, Pennsylvania and Houston, Texas were not obtained. Each document(s) collected has been reviewed for information regarding job creation, taxes, traffic (automobile, pedestrian, public transit, and parking), noise, pollution, and crowding.

In addition to the review of planning documents, interviews with the parties involved in the relocation to Somerville are equally important. The goal, after receiving institutional review board approval, was to interview Mark Abbott, President of Major League Soccer; Brian Bilello, President of the New England Revolution, and Brad Rawson, Senior Planner – Economic Development for the City of Somerville. However, only the interview with Brad Rawson was conducted on February 19, 2012. Mark Abbott was not reached and Brian Bilello declined an interview since this is an active project for the New England Revolution. Rawson’s knowledge of the development and economic goals of the City of Somerville provide a perspective not available in the literature. Interview questions are provided in Appendix A.

Table 5 - Documents Reviewed

City	Team	Document(s) Reviewed	Title

Somerville, MA		Planning Documents	Inner Belt Scoping Study

*Environmental Impact Reports are required for permitted projects in California because of the 1970 California Environmental Quality Act (CEQA)

The last part of the qualitative process has been used to draw similarities of the other stadium locations and Somerville. As Santo (2005, 190) states, “a facility’s ability to impact its local economy is tied to its context.” There is not a prescribed process or attributes that deem successful stadium development but similar characteristics could predict related strengths and challenges. The stadium location and transit access have been mapped using ArcGIS and available plug-ins; they are available in Appendix B.

Chapter 5 RESULTS

To uncover potential impacts of stadium development in Somerville it is important to look at the potential impacts from other urban soccer stadiums. By reviewing 11 documents and conducting two interviews there are similarities that can be drawn to Somerville and between these sites. Although there was no standardization of reporting or results, each document provided some information regarding potential economic gain, traffic congestion, or health impacts (see figure 6).

Overview of Documents and Interviews

Of the 11 documents reviewed and two interviews conducted there was a variety of justifications for stadium development. Municipalities were looking for economic opportunity, rebranding potential, and redevelopment opportunities. Documentation ranged from one environmental report for a stadium complex that was built in 2003 to four documents for a stadium in San Jose that will begin construction this year.

More specifically, Harrison, New Jersey and Sandy, Utah both used district redevelopment documents to plan for their stadium. Portland, Oregon, majorly

renovated an existing stadium to suit MLS field and seating requirements, and San Jose focused on economic impacts. Their reports included market assessments and potential economic outcomes for the municipality and metropolitan statistical area (MSA). It should be noted that the two economic development reports for the Portland stadium included numbers based on the scenario that the existing stadium would be renovated for an MLS team and a new stadium would be built for their AAA baseball team. In actuality, the stadium was renovated but the baseball team moved to California when a stadium agreement was not reached with the City of Portland (Manning 2012).

Carson and San Jose, California both included environmental impact reports (EIRs). Carson did not have any additional planning documents for the Home Depot Center because the stadium is built on the campus of California State University – Dominguez Hills. The EIR for San Jose's stadium was completed in 2003; it was executed on the basis that the 93-acre district was being rezoned from a heavy industrial use to 3 million square feet of office and research and development use. Hotel, retail, and commercial uses are specified in the EIR but a soccer stadium is not mentioned specifically. Lastly, there were no planning documents for the stadium in Bridgeview, Illinois. In lieu of planning documents, Mike Thiessen of Madison Group Ltd, was interviewed. He is a consultant to the City of Bridgeview.

There are two stadiums with access to transit that are not covered thoroughly in this analysis. Houston, Texas (Figure 7 in Appendix B) did not have any available documents except for an Economic Development Agreement and Stadium Lease between the team and the City of Houston (City of Houston 2010). The stadium is near the home of the Houston Astros (MLB) and Houston Rockets (NBA) in a stadium district. The MLB and NBA stadiums were funded by a voter approved hotel and rental car tax (Harris County Sports Authority 2012). The Dynamo stadium is being built with private funds on land owned by the City of Houston as part of the original MLB and NBA deals. The Houston

Dynamo will lease the stadium from Houston for \$65,000 a year (City of Houston 2010).

The City of Chester (Figure 8 in Appendix B) used their stadium to redevelop and revitalize a brownfield site in their waterfront district. They projected that the stadium would bring new jobs and recreation possibilities for residents of Chester (City of Chester 2012). The stadium was funded with \$102 million from the State of Pennsylvania and gambling tax revenues, along with a \$7 million low interest loan from the state and \$80 million from private investors. The federal and state governments and the Delaware River Port Authority helped with infrastructure costs (HVS Consulting and Valuation Services 2009).

Of all the documents reviewed, all stadiums except two have opened. The Houston Dynamo will begin their 2012 season at their new stadium. The San Jose stadium will most likely start construction this year and open for the 2013 season. A previous December development permit approval was appealed by residents asking for further review of the lighting and noise associated with the stadium. They also wanted a ban on noisemakers like vuvuzelas and fireworks. Their appeal was denied and the planned development permit was upheld on February 22, 2012 (Earthquakes Media Relations 2012; Seipel 2012).

Stadium Development

More than making the stadium an anchor of a mixed used development, another trend is to make stadiums part of an entertainment district. The goal of these developments is to make the whole district a destination for visitors. This is seen in the Sandy, Utah Civic Area planning document: "The plan, in general, provides a vision for the Area that enhances the existing retail, entertainment, hospitality, sports, office, and residential components as a basis to create a true integrated mixed-use designation attracting significantly more people with substantially increased economic activity" (Sandy City Community Development Department 2012, 7). Their plan includes branding

specific to the district and to "...create the perception of a higher value of the Area for residents and visitors and differentiate the area from other projects of destinations" (Sandy City Community Development Department 2012, 15).

The average MLS stadium hosts 50 events per year of varying sizes (Sports Economics 2008). San Jose acknowledges the importance of events throughout the year to attract residents and visitors year round (Sports Economics 2008). All of the stadiums except Portland are part of larger development plans. Harrison aimed to make a regional destination in their waterfront redevelopment plan and San Jose would like to make an extension of their downtown (City of Harrison 2003; Bay Area Economics 2006). The Inner Belt Scoping Study (2008) identified the importance that the neighborhood should identify a program that would create a unique identity; a stadium was one possible concept. Similar to Houston's stadium district, the Home Depot Center is part of an athletics development that includes practice facilities for the US National Soccer Team, a velodrome, track, and facilities for CSUDH athletics (The California State University 2001).

Although, the majority of MLS stadium planning aims to make stadiums part of mixed use developments, the recent economic downturn has made additional development difficult to achieve. Firehouse Falls, a hotel development with an indoor water park, was proposed for complementary development for Toyota Park. The project was abandoned due to economic reasons and the City of Bridgeview is still looking for a complementary development (Thiessen 2012). In Harrison, redevelopment has been slower than expected even though there is progress on several projects (Mokha 2011). Municipalities have had to readjust their timelines for development.

Economic Development and Employment

Even if not an economic development report specifically, the majority of documents mentioned at least employment opportunities and spending in the

local economy. Some of the economic development documents quantified the outcomes of the stadium developments while others implied the opportunity. The economic development reports also summarized benefits outside of the stadium.

Both economic development and planning reports cited the need for new jobs. New stadium developments are often expected to be employment generators (Curry, Schwirian, and Woldoff 2004). Of the reports that do none cite specific numbers, The Home Depot Center (Figure 9 in Appendix B) EIR reviews employment growth with an environmental perspective. It cites “marginalized job growth” at a scale that would not affect the regional population (The California State University 2001). The Sandy, Utah Master Plan (Figure 10 in Appendix B) and Harrison Plan (Figure 11 in Appendix B) focus on creating a wide range of employment opportunities and an equitable distribution of jobs (Sandy City Community Development Department 2003; City of Harrison 2003). More vaguely, the Inner Belt Scoping Study (2008) sees the district as a place for economic opportunity.

Some hiring was not quantified by other reports. For instance neighborhood restaurant owners in Carson, California, reported that their revenues rise by as much as 30-40% on game days, which could increase the demand for staff (Bay Area Economics 2006). The City of Bridgeview (Figure 14 in Appendix B) did not quantify jobs generated by the stadium. Thiessen believes that the majority of people that work at the stadium live within 5 miles and use the stadium jobs as supplemental income (Thiessen 2012). San Jose views any increase in employment as a way to balance the housing to jobs ratio and make San Jose less of a bedroom community (City of San Jose 2003).

Two reports published employment numbers for construction of the stadium. The MLS and AAA baseball scenario would generate 1,200 full time construction jobs (Economic Research Associates 2008). In San Jose (Figure 12

in Appendix B), construction activity is expected to generate 14,542 jobs (part and full time) and \$879 million in wages (Economic & Planning Systems, Inc. 2008).

Employment created by the stadium operation is much lower than the temporary construction jobs created. The Portland (Figure 13 in Appendix B) stadium is expected to generate 205 full time equivalent (FTE) jobs and 51 jobs outside of the stadium (Economic Research Associates 2008). The San Jose stadium is expected to create a combined 1,480-1,860 jobs both in the stadium and outside of the stadium (Sports Economics 2008).

Of the reports reviewed there is a range of 256-1,860 stadium and ancillary service jobs created and 1,200-14,542 construction jobs created. However, the metrics used are barely comparable. The reports don't always report in full time equivalent numbers as well as separate stadium employment from an increase in neighborhood employment.

The other economic development impacts are generally summarized as spending benefits. These spending benefits are often based on different aggregates like spending within the city, county, or MSA. The average San Jose spectator is expected to spend more outside of the stadium than inside it. It is estimated that fans will spend \$77 per day outside of the stadium and \$51 inside. This adds up to \$24 million dollars of spending outside of the stadium (Sports Economics 2008). Sports Economics (2008) expects the San Jose stadium to contribute \$49.6 to \$62.3 million dollars in direct and indirect spending to the City. Likewise, the Portland stadium is expected to bring in \$1.9 million of spending outside of the stadium within Multnomah County (Economic Research Associates 2008).

Instead of analyzing spending on a per fan basis, Sports Economics (2008) researched other professional sports teams and found that slightly more than 20% of the budgeted annual expenditure of a team will be spent in its

city. Since the Earthquakes' annual budgeted expenditures are \$15 million, a projected \$3 million would be spent in San Jose.

Another aspect of local economic development related to stadiums focuses on municipal benefits like an increase in tax revenues. Building on the site turns it into a productive site in terms on tax dollars rather than an unproductive site, one with few buildings or a use with a low property tax rate (Thiessen 2012). Many times the redevelopment includes an entire mixed-use district in which the stadium serves as the anchor tenant.

Harrison, New Jersey, Bridgeview, Illinois, and San Jose, California all had industrial uses prior to their stadium development (City of Harrison 2003; City of San Jose 2003; Thiessen 2012). The Harrison Waterfront District has an industrial heritage that left them with 20 properties with environmental contaminants. The waterfront plan states several benefits of redevelopment including a strengthened and diversified tax base, expanded retail and housing options, and an increased value in the housing stock (City of Harrison 2003). This all leads to increased tax revenues for the city.

The Sandy Master Plan acknowledged that the private market was not able to get the full value out of their property when redevelopment was needed. They wanted to stabilize declining neighborhoods and commercial property values (Sandy City Community Development Department 2003). The stadium site was undeveloped and the canals that bordered the site were suffering from maintenance problems, illegal dumping, and burglaries in the vicinity (Sandy City Community Development Department 2003).

In addition, the San Jose EIR (2003) explains that the objective of the project is to prepare the site for uses consistent with the San Jose General Plan. The site, in its current condition, is underutilized and mostly vacant. An infill development is encouraged in the General Plan because an increase in property value would increase property tax revenue (City of San Jose 2003).

The only documents that quantified tax benefits were for San Jose (Economic and Planning Systems 2008 and Sports Economics 2008). The proposed 2.25 million square feet of mixed-use development is estimated to generate \$1,722,145 of sales tax revenue (Economic & Planning Systems 2008). This will help fulfill one of their goals outlined in their EIR (2003): a stronger tax base. None of the documents quantified the increased income in property taxes. This is possibly due to stadium financing agreements that sometimes forgive tax payments.

ENVIRONMENTAL HEALTH

A stadium development brings an influx of fans, traffic, and noise into a neighborhood. The EIRs required for the San Jose and Carson stadiums were the only documents that summarized emissions and impacts during and post construction (The California State University 2001; City of San Jose 2003). Other planning and economic development documents did touch on at least one factor contributing to environmental health aspects of a stadium development although in a qualitative way.

Traffic

One of the downsides of regional attractions, like a stadium, is traffic (Rawson 2012). Most documents at least mentioned increased traffic due to the stadium. However, each municipality studied traffic differently and used non-compatible quantification methods such as cars per day, vehicle trips, and increased trips. Some municipalities only knew their baseline traffic numbers. Harlem Avenue, the main thoroughfare in Bridgeview, Illinois hosts 60,000 vehicles per day (Thiessen 2012). In Sandy, Utah, Interstate 15, the nearest interstate to the stadium, carried 171,726 cars per day in 2001. State Street, which borders the stadium, carried 32,390 vehicles per day in 2001 (Sandy City Community

Development Department 2003). In Sandy, existing traffic and congestion was reported to be hindering business and in Bridgeview the stadium development was meant to support existing businesses on Harlem Avenue (Sandy City Community Development Department 2003; Thiessen 2012). Sandy identified congestion as a major problem for businesses in the master planning area (Sandy City Community Development Department 2003). A stadium development in Somerville tested for 20, 40 and 60% transit use estimates a 1,300-2,700 increase in vehicle trips (CBT et al. 2008). Emissions and mitigations strategies for traffic in the Bridgeview, Sandy, and Somerville reports were never identified.

The EIR for the Home Depot Center and San Jose stadiums quantified the increased number of vehicles and their emissions. In Carson, there was an expected increase of 698 vehicles on non-event weekdays and up to 6,646 vehicles on weekend sold-out event days. The additional traffic would contribute to an increase in eight-hour carbon dioxide concentrations that violate the California Ambient Air Quality Standards and an increase in carbon dioxide, volatile organic compounds, and nitrous oxide on event days that violate the thresholds for the South Coast Air Quality Management District. There were 19 mitigation measures suggested to ease traffic at four intersections and additional measures to safeguard the neighborhood like strategies to minimize cut-through traffic (The California State University 2001).

The EIR for San Jose (2003) estimates an increase of 3,441-3,534 vehicle trips. The additional trips would impact three local intersections and create a need for increased capacity to 16 freeway segments. The increase in emissions was predicted to impact regional air quality, and the developed site would increase levels of volatile organic compounds, ozone, and particulate matter (PM10). Increases in these pollutants can lead to eye irritation, respiratory impairment, and aggravation of heart and lung disease symptoms (San Jose 2003).

Mitigation measures include a new public transit station and a carpooling program (Bay Area Economics 2006).

Parking

Traffic related to a stadium event also results in a parking problem during event times. Urban stadium sites have been trying to manage the problem without a sea of asphalt around the stadium. In Carson there is a need for an additional 4,166 parking spaces that could not be accommodated on the CSUDH campus. Measures were proposed to reduce significant impacts of parking in four neighborhoods near the stadium like resident permit parking. The EIR did note that there would be no carbon dioxide hot spots in the parking lots before or after the event (The California State University 2001).

Other planning documents only mentioned parking. Sandy, Utah acknowledged that the Gateway District will still be auto oriented and that convenient and accessible parking is important. However, they want parking away from primary views in order to maintain a “more positive community image” (Sandy City Community Development Department 2003, 57). In Harrison, New Jersey, their formula allowed one parking spaces for every six seats, not to exceed 5,000 spaces (City of Harrison 2003). The San Jose mixed-use development project proposed adding 9,600 parking spots which would cover 62% of the site (City of San Jose 2003).

Public Transportation

All of the stadiums reviewed have access to public transportation. In addition, several communities used their stadium as part of a transit oriented development (TOD). Harrison wanted to capitalize on the existing commuter traffic that the train station provided. Since Harrison is only eight miles from downtown Manhattan and one mile from Newark, the waterfront redevelopment plan focused on making the area desirable for commuters

and attracting new residents (City of Harrison 2003). The proposed San Jose stadium and commercial development have access to a train and several bus lines. The Portland stadium has always utilized the existing network including buses and the light rail system (Economic Research Associates 2008).

Sandy acknowledges that, "An aggressive, comprehensive transportation system is vital to the long term vigor of Sandy City" (Sandy City Community Development Department 2003, 21). In the Civic Area plan they acknowledge that the convergence of the interstate, light rail, and commuter rail can create an opportunity to reduce vehicle miles travelled. Sandy goes as far as to introduce the idea of a personal rapid transit network within the civic arena district. Personal rapid transit networks are a system of personal vehicles available at collector stations that can run directly to other collector stations instead of making additional stops like a traditional rail network (Sandy City Community Development Department 2012).

The other aspects of transit-oriented development include accessibility for pedestrians and bicyclists. Portland was already a bicycle friendly city (Economic Research Associates 2008). The Harrison plan focuses on the pedestrian's circulation and experience at the street level (City of Harrison 2003). They also plan for bicycle racks along commercial roadways. The Sandy master plan acknowledges the need for increased pedestrian access like benches and shade trees and a street network within the civic area that is safe and efficient for pedestrians, cyclists, and transit users (Sandy City Community Development Department 2003; Sandy City Community Development Department 2012). In Sandy, instead of including bicyclists on roadways, they are including connections throughout the district to the local trail network that connects the district to the whole community (Sandy City Community Development Department 2003). The Inner Belt plan not only sees an increase in transit due to the green line extension but a link to open space at the station locations (CBT et al 2008).

For other cities, transit options have been increased since the stadium was built. For instance, Bridgeview has started running shuttles between the subway station and the stadium on game days (1.25 miles). They admit that transportation access to the stadium needs to improve in Bridgeview (Thiessen 2012). Urban stadium developments are increasingly considering current and proposed transit systems and incorporating the experience of the pedestrian, bicyclist, transit and automobile user into their designs.

Noise

Noise in and around soccer stadiums can be the result of construction of the stadium, an event, traffic or people entering and leaving the stadium. During construction, the EIR for the Home Depot Center (2001) recommended that heavy impact equipment within 200 feet of residential units should use a noise barrier. Post occupancy, there were several measures suggested to mitigate noise impacts. For instance, stadium events can only increase the noise level in adjacent neighborhoods by five decibels over the non-event day noise levels. This is attainable with acoustic panels and a land berm to absorb sound. In addition, tailgating and air horns are prohibited (The California State University 2001).

Unfortunately, the EIR identified some impacts that were unavoidable and that could not be mitigated. They include traffic noise and aircraft flyovers. Events and set up and tear down times are limited and neighborhood impacts of traffic noise and pedestrian activity are suggested to be mitigated by proactive planning and management of parking. Management of noise also identifies the importance of a strong working relationship between the stadium and the surrounding neighborhoods (The California State University 2001).

The San Jose development is adjacent to an airport. The reporting of noise in the EIR related to aircraft noise versus stadium noise. San Jose aims to avoid interior noise levels above 45 dBA. To reduce noise impacts they recommend

that projects be reviewed by an acoustic consultant, maintain a minimum setback from existing noise sources, and use noise mitigating building materials like insulation. They further restrict outdoor uses in areas with an average over 60 dBA (City of San Jose 2003).

Lighting

The only document addressing lighting is the EIR for the Home Depot Center. There was no mitigation available for the marquee signs. Since the signs are perpendicular to the freeway and use direction louvers to aim the light, this was regarded as an aesthetic impact instead of a health impact (The California State University 2001).

Environment

Only San Jose and Carson, California summarized environmental losses of development because of the state required environmental impact report. Carson residents lost the view of the vista on the CSUDH campus due to the stadium development (The California State University 2001). The San Jose development will cause the loss of mature trees but they developed a plan to keep the five largest oak trees and a ratio of replanting depending on the size of the trees lost. Lastly, the San Jose development identifies losses to the Burrowing Owl habitat (City of San Jose 2003). Both the San Jose and Harrison, New Jersey sites required remediation from hazardous materials, although little detail was provided in the planning documents (City of Harrison 2003; City of San Jose 2003).

Other Benefits

The majority of the documents reviewed mentioned the less tangible reasons for a stadium development that are described in the Literature Review (Delaney and Eckstein 2003a). Bridgeview and Harrison are redefining their cities from their industrial past. Bridgeview's Mayor Steve Landek has the vision to change

Bridgeview from a manufacturing and distribution hub into an urban village (Thiessen 2012). Harrison is a city that depended on industry for employment but wants to be “capable of supporting and attracting the diverse uses important in the 21st century” (City of Harrison 2003, 5). Even CSUDH saw the opportunity in hosting a soccer specific stadium. The soccer stadium fit into the campus plan and university mission to enhance the “prestige and visibility of CSUDH” (The California State University 2001, 1).

San Jose was the only city to mention the benefits of the increased media exposure. MLS plays in seven of the 10 largest media markets and has the ability to reach 180 million households through an agreement with ESPN International. There are 10 million television viewers annually (Sports Economics 2008). The media coverage is considered free media for the municipality.

San Jose is also the only city to mention the emotional benefits to residents. They say that these are greater than the financial benefits of hosting a team. The economic development report uses the terms “psychic impact” and “public consumption benefits” but notes that quantifying the increase was outside of the scope of their study (Sports Economics 2008, 5).

COMPARISONS TO SOMERVILLE

There are many similarities between the MLS host communities reviewed and Somerville. These commonalities can help Somerville navigate the stadium development process. There are similarities in goals for job creation, redevelopment of neighborhoods, and demographics. In my interview with Brad Rawson, Senior Planner – Economic Development for the City of Somerville, he was able to share some of the City’s goals for development in

the Inner Belt and Brickbottom neighborhoods that strengthens some of these similarities.

Somerville is seeking a variety of sectors with a mix of employment opportunities for existing and new residents, but wants development to fit within the existing community. Somerville does acknowledge that the solution is not to create a heavy commercial district like Kendall Square in Cambridge. Kendall Square is lacking in neighborhood qualities including residential development and feels more like a business center (Rawson 2012). San Jose's plan of a mixed-use development was used to bring more employment to the city to make it less of a bedroom community to San Francisco and Oakland (City of San Jose 2003). A mix of residential and commercial development is what gives a neighborhood an active street life and makes residents feel safe in their neighborhood (Rawson 2012). Somerville wants to see more opportunities for employment of their residents in Somerville since 85% of its workforce population leaves the City each workday (The City of Somerville 2008).

All of the stadiums except Portland have been developed as part of other developments. Because of the economic downturn some are still in the process of being developed. With the average MLS stadium hosting 50 events per year, this is a way to increase commercial activity around the site on non-event days (Sports Economics 2008). This further increases the commercial tax base and employment opportunities.

New development is more difficult in an existing neighborhood. Somerville has the challenge of implementing a master plan while showing support for longtime resident businesses that have been a value to the community. In

Table 7 - Population Density of Municipalities with Urban MLS Stadiums

Stadium Location	Team Name	Population (2010 Census)	Land Area (Square Miles)	Density (Population/ Land Area)
Bridgeview, IL	Chicago Fire	16,446	4.1	4,011
Houston, TX	Houston Dynamo	2,100,000	601.7	3,490
Carson, CA	LA Galaxy & Chivas USA	91,714	19	4,827
Harrison, NJ	NY Red Bulls	13,620	1.3	10,477
Chester, PA	Philadelphia Union	33,972	6	5,662
Portland, OR	Portland Timbers	583,776	145.4	4,015
Sandy, UT	Real Salt Lake	87,461	22.4	3,905
San Jose, CA	San Jose Earthquakes	945,942	180	5,255
Somerville, MA		75,754	4.1	18,477

Source: 2010 Census

addition, Somerville is anticipating the Green Line Extension and is expecting the Washington Street stop (that will service the Inner Belt and Brickbottom neighborhoods) to spur development before its 2016 opening date. The Green Line Extension will also serve as a catalyst to make the neighborhoods more accessible to pedestrians and cyclists; Somerville acknowledges that the Inner Belt and Brickbottom neighborhoods are not very accessible. That being said, development has to balance the vision of any neighborhood with the market realities (Rawson 2012).

Rawson was able to talk about Somerville's interest in regional attractions but not specifically a soccer stadium. In fact, a soccer stadium would be a regional attraction and Somerville has interest in hosting these types of events. Regional attractions increase people's awareness of Somerville and can strengthen the Somerville brand. Soccer is a multicultural sport and connecting that to Somerville could be a special thing (Rawson 2012). Similarly, Bridgeview, Illinois and Harrison, New Jersey had manufacturing pasts similar to the Inner Belt and Brickbottom neighborhoods and used their stadiums as municipal rebranding tools. They developed a vision for a more modern city that is similar to the approach taken by Mayor Curtatone, who has been in the process of redefining Somerville since his first term started in 2003. This includes a three-year

community vision process released February 24th, 2012 entitled SomerVision, a 2010-2030 Comprehensive Plan (City of Somerville 2012).

Lastly, of the eight urban stadiums outlined for review, only three are major metropolitan areas, Houston, Portland, and San Jose. Houston and Portland both had previous structures for stadium development, an existing neighborhood and stadium respectively. The remaining five are dense urban edge cities to major metropolitan areas (see Table 6). The density of these cities makes them more likely to be walkable and bikeable like Somerville (Churchman 1999).

These 11 documents and 2 interviews reveal that Somerville has many characteristics similar to other urban MLS host communities. Some cities share a manufacturing past, density of residents, or a need for economic development. However, Somerville is a unique community and no MLS host community will ever be exactly the same.

Chapter 6

COMPARISONS AND RECOMMENDATIONS FOR SOMERVILLE

The New England Revolution have outlined requirements for stadium development and Somerville has outlined development requirements for the Inner Belt and Brickbottom neighborhood. The Revolution want an urban stadium site, access to public transportation, and a municipality that is willing to work with them on support of the stadium (NECN 2012). Dell’Apa, of the Boston Globe, believes that they also want financial support from a municipality. The City of Somerville wants new development to fit in the current urban fabric of Somerville but also spur job creation.

It is no surprise that the Revolution have looked at Somerville as a potential stadium site. MLS teams have gravitated towards developing stadiums in urban municipalities that are close to major metropolitan areas; Somerville is more densely populated than any other urban soccer stadium community that was studied. The Green Line extension, in particular the Washington Street station, will provide transit access to the neighborhood and any future development. Lastly, Mayor Curtatone has demonstrated that he has the ability to work with residents on important issues. This can be seen in the visioning work in neighborhoods around the City.

There are also implications in the media that the Revolution are looking for financial support that need to be considered. Somerville has acknowledged that transit access and infrastructure improvements are important for redevelopment (City of Somerville 2011e). Somerville can fairly support development of all types by investing in infrastructure improvements. These improvements could be similar to the public private partnership that Somerville has with the developers of Assembly Square (City of Somerville 2011d).

Regarding the development of a soccer-specific stadium in Somerville, the City should consider commissioning reports that explore both economic development and environmental health concerns. A report focused on economic development issues would study the potential employment, indirect, and direct spending created by the stadium and ancillary developments. Of the four economic development reports reviewed it is clear that these are contextual to their site and development parameters. These reports are increasingly complex when the site is yards away from other municipalities with a variety of development types, stakeholders, and development time lines.

Although an Environmental Impact Report will most likely be required for a redevelopment project in the Inner Belt and Brickbottom neighborhoods⁵, the environmental health implications of a soccer stadium should be explored with a Health Impact Assessment. This would be similar in scope to the EIRs from San Jose and Carson and would include health outcomes and possible mitigation strategies to combat increased traffic, noise, and crowding. The two existing residential developments in the Inner Belt and Brickbottom neighborhoods are the most important to the study but the assessment should also include residents of East Somerville and residential development in Inner Belt and

5 The Massachusetts Environmental Policy Act requires EIR for projects requiring agency action. 301 CMR 11.00: MEPA Regulations. 2012. <http://www.env.state.ma.us/mepa/regs/11-01.aspx> (accessed April 16, 2012).

Brickbottom. East Somerville already shoulders the burden of infrastructure and emissions of regional transportation and that burden should not be increased.

Somerville is already planning for the future of the Inner Belt and Brickbottom neighborhood and is including residents in a visioning process. An increase in development in the Inner Belt and Brickbottom neighborhoods would increase property tax income but Somerville has to balance existing businesses and residents with the context of a changing neighborhood. An economic development study and health impact assessment will help guide Somerville through the potential redevelopment process.

Chapter 7

CONCLUSION

For this thesis, I reviewed the potential economic development and environmental health impacts of a soccer specific stadium development. I provided a brief history of stadiums in the Boston metro area, the history of Somerville, and Major League Soccer and the New England Revolution in the Background Chapter. Then I grounded my research in the current literature on stadium planning, development, and the environmental health impacts of stadiums. Finally, I reviewed 11 documents from other urban MLS stadiums and made recommendations to Somerville.

There were some limitations to my methodology. I was not able to access documents for Houston, Texas or Chester, Pennsylvania. Documents may have been accessible if requested using the Freedom of Information Act. Planned interviews with MLS and the New England Revolution were not possible.

Throughout the review process, each of the documents shared some similarities with Somerville whether it was a common manufacturing past or a need for an increased tax base. In the least, Somerville can use the compilation of documents for an internal review. However, I hope they are able to use my

research and suggestions for an economic development study and health impact assessment to further inform a potential stadium development in the Inner Belt and Brickbottom neighborhood.

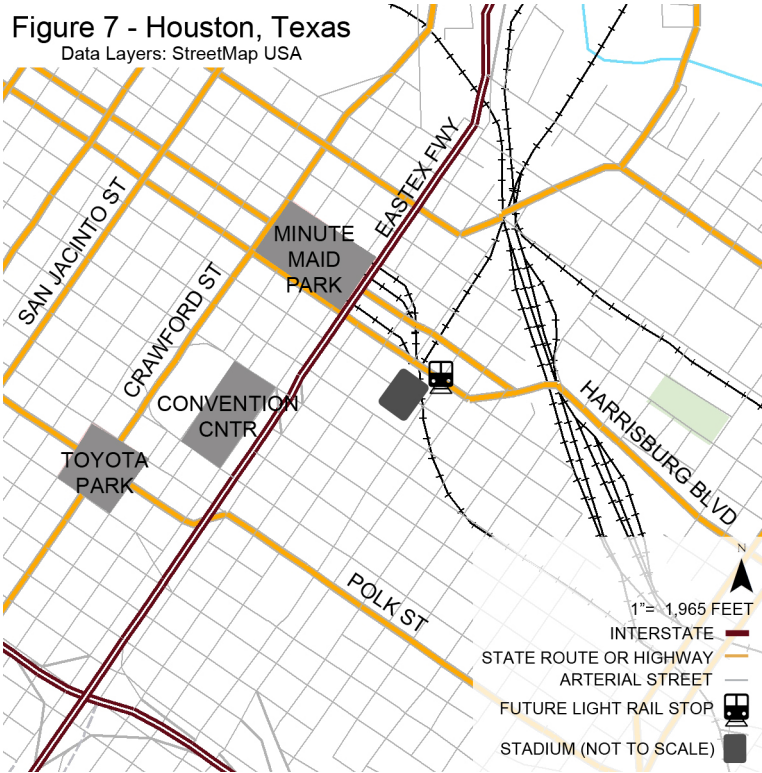

APPENDIX A

Interview Questions for Brad Rawson the Senior Planner for Economic Development in the Mayor's Office of Strategic Planning & Community Development for the City of Somerville.

1. How does the City of Somerville define successful development?
2. What is the role that the city plays in development of the Inner Belt/Brickbottom neighborhood?
3. What are some challenges Somerville is facing with redevelopment of underutilized site?
4. What are Somerville's goals in redeveloping the Inner Belt/Brickbottom neighborhood?
5. Who are the stakeholders at the City of Somerville that make development decisions?
6. Is Somerville reaching out to other communities for examples of successful development?
7. What is the timeline for development of the Inner Belt/brickbottom neighborhood?
8. What is the position of the City of Somerville on a 25,000 seat stadium in the Inner Belt/Brickbottom neighborhood?
